

NEON SOLUTIONS

Fire Safety & Security Systems

NEON SOLUTIONS Fire Objective: -

Fire & Safety services provider in the field of Fire Protection, Detection and Annual Maintenance of Fire Fighting Systems.

Introduction: -

We take this opportunity to introduce ourselves as the system integrators of fire protection and detection systems. We offer a comprehensive, integrated suite of services and solutions designed under one roof to meet your requirements.

Services:-**Fire Hydrant System**

- Automatic Fire Sprinkler System
- Automatic Fire Alarm / Detection System
- Fixed and portable fire extinguishers
- Clean agent fire suppression system
- Gas suppression system
- Deluge, water spray and Foam systems.

SECURITY SERVICE: -

- CCTV
- Fire Alarm system
- Public Address system
- BMS systems.

About US:-

- Maintaining the fire stations regards including the tech-manpower and equipment.
- Supply, erection and maintaining the fire hydrant systems and pump sets with auto control panel.
- Supply and maintaining the fire vehicles.
Supply and maintaining the first aid fire fighting systems.
- Supply, erection and maintaining the Fire Alarm systems (FDA), Sprinkler systems, Public Address system including auto panel and communication systems wherever necessary.
- Supply, fabrication and erection of complete range of pipe lines.

Scope:-

Our Main concept of business is to bring the Tech man power services and maintenance of fire equipment under one shelter including design, supply, and erection and commissioning of firefighting systems. We have very well experienced team of technical expertise and skilled manpower in above mentioned fields.

Also, we provide both technical and non-technical manpower for annual maintenance of various systems or for periodical Maintenance as per customer requirements.

Product List:-

- Fire Hydrant System & Sprinkler System (piping) Designing, supplying and instillation.
- Fire Detection and Alarm Systems
 - Security
 - PA Systems
- Supply of Fire & Safety Equipment's.
- Intelligent addressable & conventional.

ACTIVE FIRE PROTECTION:-

- WATER BASE SYSTEM
- POWDER BASE SYSTEM
- GAS BASE SYSTEM

WATER BASE SYSTEM

1. HYDRANT SYSTEM
2. SPRINKLER SYSTEM
3. SPRAY SYSTEMS
4. FOAM SYSTEM

HYDRANT SYSTEM: - Fire hydrant installation consists of a system of pipe work connected directly to the water supply main to provide water to each and every hydrant outlet and is intended to provide water for the firemen to fight a fire. ...

The Fire Hydrant Line is always kept pressurized with water.

SPRINKLER SYSTEMS:-

A sprinkler system consists of a water supply (or supplies) and one or more sprinkler installations, each installation consist of a set of installation control valves and a pipe array fitted with sprinkler heads. The sprinkler heads are fitted at specified locations at the roof or ceiling, and where necessary between racks, below shelves, inside ovens or stoves or below obstructions.

A sprinkler has two functions to perform. It must first sense the heat, and must then provide an adequate distribution of water to control or extinguish the fire. Each function is performed separately and one is independent of the other except insofar as early detection makes extinction easier because the fire has not grown large. The classic use of the sprinkler is in the hot gas layer which forms beneath the ceiling of an enclosure in which a fire is developing..

SPRAY SYSTEMS:- A special fixed pipe system connected to a reliable source of fire protection water supply and equipped with water spray nozzles for specific water discharge and distribution over the surface or area to be protected. The piping system is connected to the water supply through an automatically actuated Deluge Valve which initiates flow of water. Automatic actuation is achieved by operation of automatic detecting equipment installed along with water spray nozzles. There are two types of systems namely High Velocity Water Spray System and Medium Velocity Water Spray System.

I) High Velocity Water Spray System

High Velocity Water spray systems are installed to extinguish fires involving liquids with flash points of 65 deg. C (150 deg. F) or higher.

It was found however that water applied in the form of the finely broken needles to create an emulsion possessed a high resistance to electric current. This equipment is now more or less standard for live oil filled electrical gear and is quite commonly installed for the protection of electrical equipment carrying voltage of 400 KV or more

I) Medium Velocity Water Spray System

Advance in technology have brought about much wider usage in industry of highly inflammable liquids, gases and solids. The fire problems so produced have required new thinking and

development of new technologies. With fire risks involving the lighter oils, liquefied petroleum gases and other flammable liquids with flash points below 65 deg.C it may not be possible or even desirable to extinguish the fire completely. Under such circumstances the aim is to achieve controlled burning. Adequate control of such fires and also protection of vessels and plant exposed to surrounding fire can be achieved by properly designed medium velocity water spray system. Cooling smothering and dilution play apart in varying degrees with such a system This type of system utilizes sprayers which produce a medium velocity water discharged with directional properties operating at a minimum water pressure of approximate 1.5 bar sprayers can be arranged for individual automatic operation or for automatic and manual operation in groups to command the plant or fire area concerned. Here again, the essence of the design is proper discharged pattern, careful hydraulic calculation and balance of flow and pressure. All systems are fitted with alarm equipment and monitoring devices as required.

General Information

Medium velocity water spray system has been developed and extensively installed for the following applications.

For the protection of vessels, plant, and structures exposed to heat from adjacent and surrounding fires.

FOAM SYSTEM:-

Foam for fire protection purposes is an aggregate of air-filled bubbles formed from aqueous solutions and is lower density than the lightest flammable liquids. It is principally used to form a coherent floating blanket on flammable and combustible liquid lighter than water and prevents or extinguishes fire by excluding air and cooling the fuel. It also prevents re-ignition by suppressing formation of flammable vapour's. It has the property of adhering to surfaces, providing a degree of exposure protection from adjacent fires.

Foam may be used as a fire prevention, control or extinguishments agent for flammable liquid tanks or processing areas. Foam solution for these hazards may be supplied by fixed piped systems or portable foam generating systems. Foam may be applied by foam discharge outlets, which allow it to fall gently on the surface of burning fuel or it may be introduced by other means. Foam may also be applied to these hazards by portable hose streams using foam nozzles, portable towers or large capacity monitor nozzles.

POWDER BASE SYSTEM:-**DRY CHEMICAL POWDER TOTAL FLOODING SYSTEM**

Description : Dry chemical fixed pipe fire suppression systems are self-contained units, designed by factory trained personnel, consisting of a pressure vessel constructed to ASME standards, nitrogen cylinders , automatic detection devices and electric/pneumatic manual actuation devices.

**Gas Based System****FM200 Gas Extinguishing: -**

FM-200® Fire Suppression agent was the first environmentally acceptable replacement for Halon 1301. FM-200® has zero ozone depleting potential, a low global warming potential and a short atmospheric lifetime. It is particularly useful where an environmentally acceptable agent is essential, where clean up of other media presents a problem, where weight versus suppression potential is a factor, where an electrically non-conductive medium is needed, and people compatibility an overriding factor.

FM-200® is a colourless, liquefied compressed gas. It is stored as a liquid and dispensed into the hazard as a colourless, eclectically non-conductive vapour that is clear and does not obscure vision.

PASSIVE FIRE PROTECTION:-

DETECTION ALARM: -Fire detection systems have increased in complexity and sophistication as technology has advanced. In particular, the increased computing power now available through the development of low-cost processors has enabled system designers to improve functionally through incorporating numerous features and options into the fire detection system, both in the detector head and in the control panel. However, not all installations will require the ultimate in facilities and features, and there is still a strong demand for relatively simple conventional systems.

There are four elements of a fire system :

- a) The Detectors
- b) The Control Panel
- c) The warning sounders and strobes
- d) Ancillary devices such as door closers and fan shut-down units.
